Modern Manufacturing Concepts & Principles
(MCP 200)

(Formally LCP100)

Target Audience:

All manufacturing personnel, targeted for hourly production personnel, yet not limited to any specific classification or department.

Benefits:

Through an adult learning model, including interaction, exercises, classroom lecture and discussion, the comfortable atmosphere provides participants with an in depth knowledge of the entire process of manufacturing, SQDCME, and Lean Manufacturing. In addition, the course will explain the process of what impact their behavior and actions have on the culture of their team, and the quality and productivity of their area. The participant will gain an appreciation of automobile production and manufacturing, and realize how their actions can affect the entire process. Through interaction and discussion with individuals from other facilities, the participants become engaged in their work environment, and gain a greater understanding of this company. Product loyalty is stressed and this attitude encourages others to buy what we build as well.

What to expect from returning participants:

Behaviorally, the boost in morale will spread throughout the team. The change is apparent in work ethic, attitude, attendance, and camaraderie within the team. An apathetic worker will not always catch the quality problems or go that extra mile to ensure productivity numbers, whereas an involved, concerned workforce will perform at world-class levels. This involvement will directly affect the quality and productivity of the individual, the team, the area, and ultimately, the company as whole.
